

Lab2 (Full stack PHP)

- 1- Create Two different types of arrays and deal and try to print single elements and all elements.
- 2- Use (Read, Write, Append) to show me how PHP deals with that type of data.
- 3- Create Page Called it "form.php" like that:

A screenshot of a web browser window titled "Registration". The address bar shows "http://localhost/registration.php". The form contains the following fields and controls:

- First Name: text input
- Last Name: text input
- Address: text area
- Country: dropdown menu with "Select Country" text
- Gender: radio buttons for "Male" and "Female"
- Skills: checkboxes for "PHP", "MySQL", "J2SE", and "PostgreSQL". "MySQL" and "J2SE" are checked.
- Username: text input
- Password: text input
- Department: text input with "OpenSource" pre-filled
- Captcha: A box with the text "Ch686a" and a small input field for the code.
- Instructions: "Please Insert the code the below box"
- Submit and Reset buttons at the bottom.

- 4- Then Transfer the form data from that page to second page called "Welcome.php" using POST method.

Best Luck 😊

Mohammed Salah
